

What is a Smart Home ?

Imagine being able to listen to your music collection wherever you are in your home without having to hunt for the CD.

Imagine having lighting systems with pre-set scenes to suit different moods and occasions, and imagine linking this into your own home-cinema setup.

Imagine being able to monitor and control your heating, lighting and security even when you're away. Just text or mail your house a simple command to set your home environment to exactly how you'd like it.

Imagine a system where any alarm whether smoke, water or intruder will trigger a text to your mobile or send you an email.

And imagine being able to do this through familiar tools like your mobile phone, PDA or web browser.

Smart Homes can be all of this and more but we believe there are two important things to bear in mind. You want your smart home to work in the way you do, and you want it to look like an integrated piece of design rather than afterthought.

Whether you're interested in

- Getting the most from your entertainment systems - photos, music, DVD & Satellite
- Developing a better environment for your home-cinema
- Controlling your home environment – lighting, heating, hot water and security - through integrated systems
- Monitoring and controlling your home when you're away

Whole House Control

Whole house control systems tie together the different technologies we work with. Touch screen panels can be used to access audio, video, lighting control systems and much more and deliver control up through a simple, unified, integrated control layer for the user. For many people this is what they mean when they talk about Smart Homes.

With custom interfaces and powerful programming tools, we can design systems that are incredibly easy to use and yet extremely powerful. Guru use RTI touch panels and remotes for their robustness, build quality and technical excellence.

Multi-Room Audio

Overview

Multi-room audio systems enable you to listen to your favorite audio everywhere around your house and garden. So whether that's the radio in the kitchen, a selection of your favorite tunes in the garden room or some mellow music as you soak in the bath in the evening, a multi-room system can deliver that from one central source and do so without the clutter of additional equipment everywhere.

And because everyone in the house is going to have their own tastes and preferences, a multi-room system has to be able to deliver different sources simultaneously to different rooms. Conversely, when you're entertaining or just as you're moving through your house, you might want your system to be playing the same synchronized source to every zone in the house.

“Multiroom audio systems enable you to listen to your favourite audio everywhere around your house and garden ”

We often tend to talk about multi-zone systems rather than multi-room. A typical example of this is a bedroom and an en-suite bathroom. Different rooms, but most of our clients don't want competing music or radio between two rooms that are so closely linked. We'll go through your requirements with you to establish exactly how you want to be able to control, separate and synchronize your music through your home. We will design a system with the appropriate number of zones for you and your lifestyle.

Benefits of a multi-zone system

Obviously you can get different music or radio in different rooms by using multiple systems. Portable radio in the bathroom, separate mini-systems in the family's bedrooms and maybe one or more "serious" AV setups in the living room, conservatory etc. Or, looked at another way, you can have all your favorite music with you all the time with a digital music player - there's a lot of people around these days with small personal players with distinctive white earphones....we'll come back to them later.

Multi-room or multi-zone systems use a different approach.

We'd summarize the benefits as being:

Design - a well designed system should give you and radio where you want without you noticing how delivered there

- Discreet speakers - ceiling or wall recessed, or even disguised
- No equipment on display apart from what you what you need to control it - unless you want it! We do have some clients who like having their equipment displayed in a listening room for instance.

Convenience - A music server can have the whole house's music stored on it and made available to anyone who wants it.

ItisGuruLtd

W -www.itisguru.com E – mark@itisguru.com

If you - or a group of you - want to play different music in different zones - say the same ambient music to your living room, dining room and terrace as you entertain while the kids listen to Linkin Park in the playroom. That sounds like a noisy house! but because a well designed system makes it easier to access your music and enjoy more of it, you'll find yourself listening to a wider range of things more often. Put simply, multi-zone systems make it easier to enjoy your music.

Quality - Convenience isn't worth much if you're forced into making compromises on quality. Audio quality and different people's perception of what quality audio is a subject too huge for here. We try to simplify things by establishing what you're trying to achieve in each zone, what your expectations are, what your budget is and designing the best possible solution to meet your needs.

Home Cinema

When people describe “Smart Homes” they often talk about a Home Cinema setup. Well designed Theatre systems are great showcases for Smart Home technology – they bring together superb audio and video, these are supplemented with great lighting and control and often feature ingenious installations that hide away the technology so you can enjoy the experience.

Video in the integrated home is about more than Home Cinema though and here we discuss some of the options open to someone considering a project.

Home Cinema sometimes called Home Theatre is all about making the most of your film and DVD viewing experience. More than just a collection of high quality components, we believe it's about creating a great environment, with discreet, flexible control systems allowing you to enjoy your video to the full. More choice, more channels, more rooms...multi-room video means having access to the video

source you want wherever you are in the house or garden.

With video distribution systems you can have multiple screens all playing the same central source – imagine watching a DVD downstairs on your home cinema setup, pausing it and resuming watching your film from the same point on an LCD in the bedroom. You can also have multiple screens all with access to different central sources with the ability to switch between them.

This is an area of change. We help you to understand what the next developments might bring and how you can best plan to get the maximum out of your investment. High Definition TV and IP based video distribution systems offer a great deal but need to be planned for now.

Lighting Control

Lighting controls systems can really enhance good lighting making the subtleties and impact of the design easy to access.

Lighting schemes frequently use a number of individual lighting circuits which together create an overall effect. The intensity of the different circuits, the speed of dimming, even the colour of the light can combine to give magical lighting effects. Lighting control systems take away the complexity of the elements involved allowing users to access different pre-programmed lighting "scenes".

Home Cinema

One obvious application of lighting controls in the home is in the growing area of Home Cinema. It has become a bit of a Smart Home cliché to describe the pressing of one button to see the screen descend from the ceiling, the projector turn on, the curtains close and the lights dim, but Home Cinema really has opened people's eyes to the possibilities of lighting control systems in the house.

Other Applications

There are many other applications. Lighting controls can replace large arrays of manual dimmer switches and provide one button access to pre-programmed scenes for eating, reading, entertaining.

"Avenues" of light can be created for the night time "

Multiple rooms or even whole house lighting schemes can be integrated. With systems allowing the user to turn off the whole house with one button and the convenience of remote controls, it is possible to lie in bed and switch off all lights in the house with a simple remote control.

"Avenues" of light can be created for the night time, so a scene can be created that just lights the route from a bedroom to the kitchen for example. Integration with other home control systems mean that this "avenue" can be intelligently triggered by motion rather than requiring a switch and for this motion sensitivity only to be triggered at certain times of the day.

Security

Lighting can be integrated into security schemes with lighting mimicking an occupied house. Again this can be programmed to be more convincing than a simple timer operated system. With some systems it is possible to "record" normal occupancy and play that back when required.

We'd summarise the benefits of lighting controls systems as offering:

1. Ease of use
2. Quality feel
3. Convenience

Degree of Reluctance

One thing we admit here is that it's difficult for many people to see the application of lighting control systems in the home. People are worried by the thought of major rewiring exercises and the cost.

It's also difficult to visualise the effects for a lighting scheme that doesn't yet exist. Yet those of our clients who have followed down this route are now fierce advocates of these systems.

Our favourite quote?

"Why didn't you convince me to do this before?"

Home Networking

When our clients talk to us about a network in the home, fast web access, email and sharing it are the most common requests. A home network is great for this and can do so much more. The home network is becoming commonplace and the possibilities it opens up are huge

Home Working

People work from home or want to have the flexibility to work from home sometimes. They want to have access to the web and email wherever they are in their house - or garden, yet they don't want the house to look like an office. A well planned home network can give you all the functionality, but no clutter and no wires and it can be simple to use. And with a reliable fast and secure internet connection it's possible to access the data on your

machines even when you're away from home. No more issues with forgetting that file.

Web and email access for the whole family

Maybe you've got more than one computer - one in the study, one or more in the Kids' rooms, a laptop. A network means everyone can share broadband and web access and it means you don't have your phone tied up for hours on end.

Broadband changes the way you use and view the internet and a network makes it simple to share

Entertainment

The explosive growth of personal digital music players like Apple's iPod and the popularity of digital cameras for photos and video mean many people now have growing libraries of digital media. Too often this library is locked away on a PC away from the rest of the house.

A home network means this need no longer be tied to that PC in the office but accessed where you want in the home and watched or listened to away from the PC on your main TV or using your living room HiFi.

Digital music can be streamed to any room in the house. Photos can be enjoyed in the living room on a large screen. Games consoles like Microsoft's XBox 360 are tapping into the power of networking to deliver entertainment content from Media Centre PCs. The network now sits at the heart of the integrated home.

We help take the mystery out of networking. We listen to what you want, explain what you can do and design a network capable of meeting your requirements now -and expanding to meet your requirements in the future.

iPort

We're really pleased with the new iPort solution that simplifies integrating iPods into a multi-room audio system and does so in a very elegant and clean way.

Integrating an iPod or two...or three or four has become a fairly standard request of our clients.

While we've had a variety of solutions that would allow iPods to be used in either standalone situations or in multi-room systems this is probably the tidiest solution to integrating iPods that we've seen to date.

At its heart the iPort is a docking station, either in-wall or the new free standing unit. What makes the iPort special is that the different models in the range offer increasingly smart ways for our clients to control their iPods from any room in the house.

The simplest iPort offers charging and the ability to output

to a local audio system. However, the options carry on from there so you can have Infra Red remote control or you can even have all your iPod music - including your playlists - available at a separate touch screen panel in any room in the house. The combination of our automation systems and iPort means your iPod effectively becomes a Music Server for any room in your house. There is even an iPort video option to let you access video and photo content from your iPod.

Transportation

Whether traveling by land, sea, or sky. Guru can provide an award-winning line of control solutions will make the trip more enjoyable by providing simplified access to entertainment options. With both in-wall and handheld control interfaces, our design can be completely customized to meet the traveler's unique demands.

Yacht

Whether listening to music or watching a movie, we can simplify control over entertainment options on the open sea. These control systems are built to meet the high standards of even the most demanding applications, so the user can be assured of reliable performance, in any environment.

Motor Coach

Guru helps bring the comfort and convenience of home to the motor coach. With the ever-expanding entertainment options available on today's motor coaches, Guru can unify control of audio and video components into one easy to use interface, helping transform the motor coach into a true - home away from home.

Aircraft

Meeting the unique control demands of the aviation industry, Guru can install systems can be completely customized to present the passenger with one intuitive interface to access music or movie selections. With little or no training, control of entertainment is just a click away.

Automobile

As more entertainment options are making the transition from the home to the vehicle, Guru's designs provide each passenger with the ability to quickly and easily control audio/video equipment. Gaming, movies, and music control are at the passenger's fingertips..

Package options

Your home can be pre-wired with an infrastructure in preparation for the addition of a variety of control and entertainment solutions that include;

Scene Lighting management Multi Room Music (interior and exterior areas) Home Cinema/theatre Surround Sound Satellite TV and DVD Distribution CCTV security PC Networking (Wi-Fi and fixed)

To simplify matters avoiding unnecessary technical confusion we have prepared a tier selection process that will assist you in selecting your preferred package to suit both lifestyle and budget. Having now read all about the smart home options you can now select from either bronze, silver or gold with each providing you with a level of technology appropriate to your living requirements.

Bronze

This package provides for multi-room music throughout using an ipod docking system or server accessible in the main living space and garden areas. SAT TV Distribution is included and can be networked to any room in the house, all you have to do is select and contract the SAT package with your local supplier.

Multi-room music (using ipod) SAT TV Distribution LAN Networking (Wired & Wi-fi)
Package Price Estimate £15,000 – £20,000

Silver

As Above with the addition of Lighting Management for all installed lighting scenes. The management system will provide you with a full interface where you can control, edit and adjust your lighting scenes in each area.

Multi-room music TV Distribution LAN Networking (Wired & Wi-fi) Scene Lighting Management – xpanel and remote access
Package Price Estimate £25,000 – £35,000

Gold

This package is as per Bronze and Silver with the added benefit of CCTV for cameras located around the exterior of the property to include web remote monitoring. (subject to fixed IP address availability). We have also made provision in this package for a Home Cinema system with a dedicated music and DVD Server for access to your music and movie collection from multiple locations.

Multi-room music TV Distribution LAN Networking (Wired & Wi-fi) Scene Lighting Management – xpanel and remote access CCTV Security and remote management Home Cinema & Movie Server
Package Price Estimate £40,000 – £60,000

Note: All packages are bespoke and designed to suit your living space. The above tier pricing is a guide to the expected budget required at each specification level.
